

dataFlow.sh README

The expected input for the command is:

```
bash dataFlow.sh <NETWORK DEVICE> <LIMIT>
```

Currently the limit is implemented in kb because I did not have enough to finish everything working. Also, I could not get the mail command to work on my machine so I simply printed what I think the statement should have been (or at least close to) in order to send an email.

The output is in a similar format as that detailed in the HW #1 definition:

```
Tue Oct 22 10:04:39 CDT 2013 Now_In_Speed: 168 kbps Now_Out_Speed: 168 kbps  
Data_Usage: 337 kb
```
